:
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                   The mouse Fused locus encodes Axin, an inhibitor of the Wht signaling pathway that regulates embryonic axis formation.";

Cell 90:181-192(197).

-I- FUNCTION: INHIBITOR OF THE WHT SIGNALING PATHWAY. DOWN REGULATES BETA-CATENIN. PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-CATENIN AND APC BY GSK-3B (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).

-I- DEVELOPMENTAL STAGE: EXPRESSED AT STAGE 12 TO 15.

-I- PIM: PROBABLY PHOSPHORYLATED BY GSK-3B AND DEPHOSPHORYLATED BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DOMAIN

dependent phosphorylation of beta-catenin.;

EMBO J. 17:1371-1384(1998).

-I- FUNCTION: INHIBITOR OF THE WNT SIGNALING PATHWAY. DOWN REGULATES BETA-CATENIN. PROBABLY FACILITATE THE PHOSPHORYLATION OF BETA-CATENIN AND APC BY GSK-3B (BY SIMILARITY).

-I- SUBGUNIT: INTERACTS WITH GSK-3B AND BETA-CATENIN. THE INTERACTION BETWEEN AXIN AND BETA-CATENIN OCCURS VIA THE ARMADILLO REPEATS CONTAINED IN BETA-CATENIN. TERNARY COMPLEX. ALSO BINDS TO PLAKOGLOBIN (GAMMA-CATENIN), APC, DVL AND PP2A (BY SIMILARITY).

-I- SUBGELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: CYTOPLASMIC (BY SIMILARITY).

-I- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN TESTIS, THYMUS AND LUNG FOLLOWED BY CEREBRUM, CEREBELLUM, HEART, KIDNEY, SKELETAL MUSCLE.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation,
                                                                                                                                              WO9911780-A2

Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the WntyWingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC)
                                                                                                                                                                                                                                                                                                                                                                                      Axin; cancer; breast cancer; colorectal cancer; gastrointestinal cancer; esophageal cancer; carcinoma; melanoma; diagnosis; treatment; therapy; thyroid carcinoma; tumorigenesis; beta-catenin.

Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Axin; cancer; breast cancer; colorectal cancer;

The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.

The method can be used for identifying agonists and antagonist of nuclear receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is the human peroxisome proliferator activated receptor-delta (PPAR-delta).

The invention relates to a method for identifying nuclear receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of the human MIN1 gene product. The protein has a mol. wt. about 129 kD. The gene is expressed at the G2/M border of the cell wycle and can inactivate the cell cycle progression protein cdc2 kinase. The gene was isolated by functional complementation of a yeast weel/mik1 mutant strain. The gene and protein can be used in the determination of cancer cell development and as an antimitotic
                                                                                                                                                                                                                                                                                           New isolated nucleic acids and secreted proteins - obtained from human adult ovary, human foetal kidney, human foetal brain and human adult brain cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   secreted protein; BP202_3

                                                                                                therapeutic agents, and for diagnostic tests. In addition, peptides corresponding to TPC2 or TPC3 proteins can also be used to regulate telomere length and telomerase activity in mammalian cells. Immunogenic peptides and proteins of the invention can also be used in therapeutic immunisation and vaccination procedures. Antibodies that specifically bind to TPC2 or TPC3 proteins can be used in screening, diagnosing and monitoring diseases and other conditions, such as cancer, pregancy or fertility.
                                                                                                                                                                                                                                         telomere length or modulates telomerase activity. Its amino acid sequence was deduced from a cDNA clone (see V19480) obtained from a human 293 cell library. TPC3 and TPC2 (see W4864) proteins can be obtained by purification from natural sources, by in vitro synthesis or by purification from recombinant host cells. They have application in methods for reconstituting in vitro telomerase or other enzymatic activities that maintain telomeres and regulate
                                                                                                                                                                                                                                                                                                                                                     This polypeptide comprises human TPC3, a protein that regulates

                                                                                                                                                                                                                                                                                                                                   This sequence is the human TPC3 protein, which is contained within the recombinant mammalian host cell of the invention. The invention provides methods and reagents for regulating telomera length and modulating telomerase activity in mammalian cells as well as for detecting, diagnosing, and treating related diseases and conditions as cancer, pregnancy, or fertility in humans and other mammals.

                                                                                                                                                                                                                                                                                                                                                                                                       neuroprotective activities. The human transmembrane proteins, polynucleotides encoding them and other compositions and methods from the present invention, can be used for the diagnosis, treatment or prevention of immune, reproductive, smooth muscle, neurological, gastrointestinal, developmental and cell proliferative disorders. The HTMPN's can be used to treat or prevent disorders associated with a decreased expression or activity of HTMPN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 256698 to 256776 encode Y57877 to Y57955 which represent human transmembrane proteins designated HTMPN-1 to HTMPN-79, respectively. The transmembrane protein have immunospecific, antiproliferative and neuroprotective activities. The human transmembrane proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GG GP900 antibody production, and to a method of cryptosporidiosis treatment CG or prophylaxis comprising administration of anti-GP900 antibodies to an chindvidual. Cryptosporidium parvum GP900 and GP900 fragments are able to competitively inhibit sporozoite or merozoite attachment or invasion, and care also useful for the generation of anti-GP900 antibodies. The cc antibodies also inhibit sporozoite or merozoite attachment/invasion, and cadditionally inhibit the binding of GP900 ligands to GP900. GP900 cc proteins, fragments and antibodies may therefore be used to treat or prevent cryptosporidiosis. Infection with Cryptosporidium is a common cc use of diarrhoea in humans and causes life-threatening diarrhoea in immunocompromised persons. Cryptosporidiosis can be contracted from cc contaminated municipal water supplies (e.g., public swimming pools). It is also a cause of disease in animals, resulting in financial losses in cc agriculture. GP900 fragments, fusion proteins and antibodies may also be used for the diagnosis of Cryptosporidium parvum infections, and for the cused for the diagnosis of Cryptosporidium parvum infections, and for the detection of the parasite in the environment. Sequences B11728-B11732 cc for GP900, which contains a putative transmembrane domain and a cortant contains a putative transmembrane domain and a

                                                                                                                                                                               Cryptosporidium parvum, DNA encoding it, GP900 fragments, and fusion CC cryptosporidium parvum, DNA encoding it, GP900 fragments, and fusion CC administration of GP900 or fragments thereof to a host to elicit anti-CC GP900 antibody production, and to a method of cryptosporidiosis treatment CC or prophylaxis comprising administration of anti-GP900 antibodies to an individual Cryptosporidium parvum GP900 and GP900 fragments are able to CC competitively inhibit sporozoite or merozoite attachment or invasion, and CC are also useful for the generation of anti-GP900 antibodies. The CC antibodies also inhibit sporozoite or merozoite attachment or invasion and CC anditionally inhibit the binding of GP900 ligands to GP900. GP900 proteins, fragments and antibodies may therefore be used to treat or prevent cryptosporidosis. Infection with Cryptosporidium is a common CC cause of diarrhoea in humans and causes life-threatening diarrhoea in immunocompromised persons. Cryptosporidiosis can be contracted from CC inmunocompromised persons. Cryptosporidiosis can be contracted from CC instantiated municipal water supplies (e.g., public swimming pools). It is also a cause of disease in animals, resulting in financial losses in agriculture. GP900 fragments, fusion proteins and antibodies may also be used for the diagnosis of Cryptosporidium parvum infections, and for the CC detection of the parasite in the environment. The present sequence CC represents the GP900 protein of the Iowa isolate of Cryptosporidium
